Your gut, gently explained

- A short tour, no biology degree needed
- Eight slides, about five minutes
- Use the arrow keys or the buttons to move

What digestion does

- Breaks food down into what your body can use
- Starts in the mouth, long before the stomach
- Takes most people one to three days from start to finish

Why pace matters

- Chewing is the first step of digestion
- Eating quickly can mean swallowing more air
- Slower meals give fullness signals time to arrive

Rhythm and timing

- Your gut has a daily rhythm, much like sleep
- Regular meal times often feel more settled
- Late, heavy dinners are a common trigger

Fibre, the slow way

- Fibre feeds the helpful bacteria in your gut
- Adding a lot at once is a common cause of bloating
- We add a little at a time from week three

The gut–brain connection

- Your gut and brain send signals to each other all day
- Stress can speed digestion up or slow it down
- A calm breath before meals helps some people

What we won’t do

- Cut out whole food groups without a reason
- Promise to fix anything in six weeks
- Replace care from your doctor

Your first step

- Print or open your symptom tracker
- Fill in the getting-started survey
- Pick one meal a day to eat a little more slowly
